Assignment 5: Data Visualization

Ellie Harrigan

Fall 2024

OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on Data Visualization

Directions

1. Rename this file `<FirstLast>_A05_DataVisualization.Rmd` (replacing `<FirstLast>` with your first and last name).
2. Change "Student Name" on line 3 (above) with your name.
3. Work through the steps, **creating code and output** that fulfill each instruction.
4. Be sure your code is tidy; use line breaks to ensure your code fits in the knitted output.
5. Be sure to **answer the questions** in this assignment document.
6. When you have completed the assignment, **Knit** the text and code into a single PDF file.

Set up your session

1. Set up your session. Load the tidyverse, lubridate, here & cowplot packages, and verify your home directory. Read in the NTL-LTER processed data files for nutrients and chemistry/physics for Peter and Paul Lakes (use the tidy `NTL-LTER_Lake_Chemistry_Nutrients_PeterPaul_Processed.csv` version in the Processed_KEY folder) and the processed data file for the Niwot Ridge litter dataset (use the `NEON_NIWO_Litter_mass_trap_Processed.csv` version, again from the Processed_KEY folder).

2. Make sure R is reading dates as date format; if not change the format to date.

```
#1
library(tidyverse)
```

```
## -- Attaching core tidyverse packages ------------------------ tidyverse 2.0.0 --
## v dplyr     1.1.4     v readr     2.1.5
## v forcats   1.0.0     v stringr   1.5.1
## v ggplot2   3.5.1     v tibble    3.2.1
## v lubridate 1.9.3     v tidyr     1.3.1
## v purrr     1.0.2
## -- Conflicts ------------------------------------------ tidyverse_conflicts() --
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()    masks stats::lag()
## i Use the conflicted package (<http://conflicted.r-lib.org/>) to force all conflicts to become errors
```

```
library(lubridate)
library(here)
```

```
## here() starts at /home/guest/EDE_Fall2024
```

```
#install.packages("cowplot")
library(cowplot)
```

```
##
## Attaching package: 'cowplot'
##
## The following object is masked from 'package:lubridate':
##
##     stamp
```

```
getwd()
```

```
## [1] "/home/guest/EDE_Fall2024"
```

```
#2
NTL.LTER <- read.csv(here(
"Data/Processed_KEY/NTL-LTER_Lake_Chemistry_Nutrients_PeterPaul_Processed.csv"),
stringsAsFactors = TRUE)
NTL.LTER$sampledate <- ymd(NTL.LTER$sampledate)

NEON.litter <-
  read.csv(here
      ('Data/Processed_KEY/NEON_NIWO_Litter_mass_trap_Processed.csv'),
    stringsAsFactors = TRUE)
NEON.litter$collectDate <- ymd(NEON.litter$collectDate)
```

Define your theme

3. Build a theme and set it as your default theme. Customize the look of at least two of the following:

- Plot background
- Plot title
- Axis labels
- Axis ticks/gridlines
- Legend

```
#3
mytheme <- theme_classic(base_size = 12) +
  theme(
    axis.text = element_text(color = "red"),
        legend.position = "top",
        plot.title = element_text(
          color = "orange")
        )

theme_set(mytheme)
```

Create graphs

For numbers 4-7, create ggplot graphs and adjust aesthetics to follow best practices for data visualization. Ensure your theme, color palettes, axes, and additional aesthetics are edited accordingly.

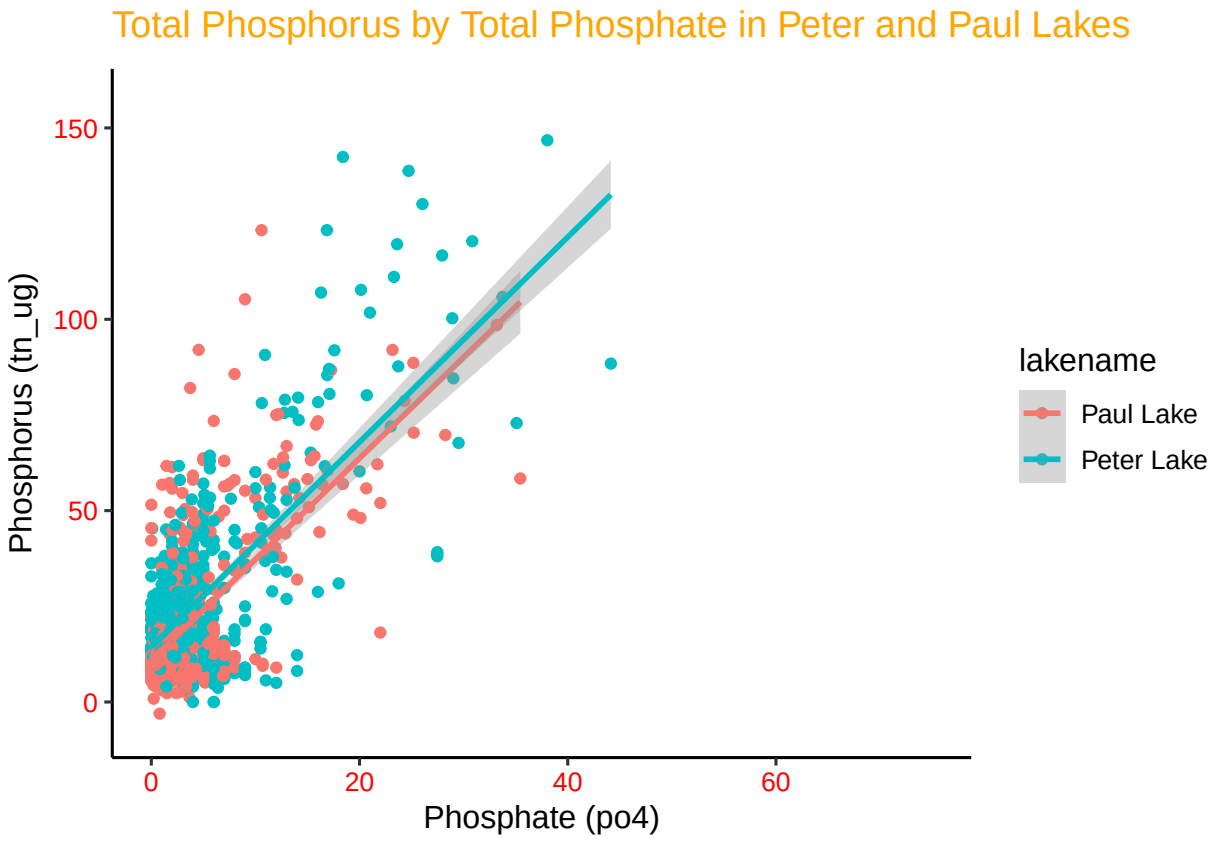
4. [NTL-LTER] Plot total phosphorus (`tp_ug`) by phosphate (`po4`), with separate aesthetics for Peter and Paul lakes. Add line(s) of best fit using the `lm` method. Adjust your axes to hide extreme values (hint: change the limits using `xlim()` and/or `ylim()`).

```
#4
plot4 <- ggplot(NTL.LTER,
                aes(x= po4, y= tp_ug, color = lakename)) +
  geom_point() +
  geom_smooth(method = lm) +
  xlim(0, 75) +
  xlab(expression("Phosphate (po4)")) +
  ylab(expression("Phosphorus (tn_ug)")) +
  labs(title =
         expression(
           "Total Phosphorus by Total Phosphate in Peter and Paul Lakes")) +
  theme(legend.position = "right")
print(plot4)
```

```
## `geom_smooth()` using formula = 'y ~ x'
```

```
## Warning: Removed 21947 rows containing non-finite outside the scale range
## (`stat_smooth()`).
```

```
## Warning: Removed 21947 rows containing missing values or values outside the scale range
## (`geom_point()`).
```



5. [NTL-LTER] Make three separate boxplots of (a) temperature, (b) TP, and (c) TN, with month as the x axis and lake as a color aesthetic. Then, create a cowplot that combines the three graphs. Make sure that only one legend is present and that graph axes are aligned.

Tips: * Recall the discussion on factors in the lab section as it may be helpful here. * Setting an axis title in your theme to `element_blank()` removes the axis title (useful when multiple, aligned plots use the same axis values) * Setting a legend's position to "none" will remove the legend from a plot. * Individual plots can have different sizes when combined using `cowplot`.

```
#5
#Change months to factors with month names
NTL.LTER$month <- factor(NTL.LTER$month,
                                levels = 1:12,
                                labels = month.abb)

#remove x axis title and change y axis label
plot5.a <- ggplot(NTL.LTER,
                  aes(x = month,
                      y = temperature_C,
                      color = lakename)) +
  geom_boxplot() +
  theme(
    axis.title.x = element_blank(),
    legend.position = "none"
  ) +
```

```
  facet_wrap(facet= vars(lakename), nrow = 2) +
  labs(y = "Temperature (°C)")
#print(plot5.a)

#remove x axis title and change y axis label
plot5.b <- ggplot(NTL.LTER,
                  aes(x = month,
                      y = tp_ug,
                      color = lakename)) +
  geom_boxplot() +
  theme(
    #axis.text.x = element_blank(),
    axis.title.x = element_blank(),
    legend.position = "none"
  ) +
  facet_wrap(facet= vars(lakename), nrow = 2) +
  labs(y = "Phosphorus")
#print(plot5.b)

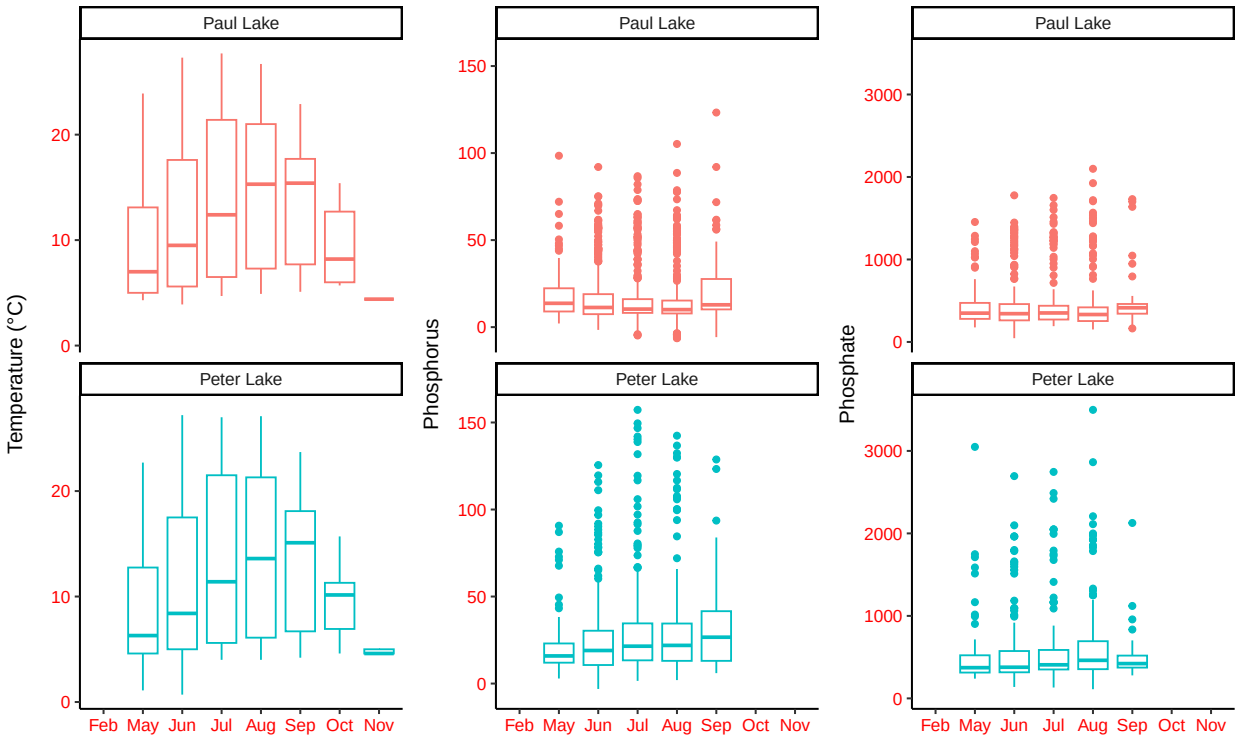
#remove x axis title and change y axis label
plot5.c <- ggplot(NTL.LTER,
                  aes(x = month,
                      y = tn_ug,
                      color = lakename)) +
  geom_boxplot() +
  theme(
    #axis.text.x = element_blank(),
    axis.title.x = element_blank(),
    legend.position = "none"
  ) +
  facet_wrap(facet= vars(lakename), nrow = 2) +
  labs(y = "Phosphate")
#print(plot5.c)

#use cowplot to put all three plots onto one page and align to be same size
plot_grid(plot5.a, plot5.b, plot5.c,
          ncol = 3,
          align = "vh",
          rel_heights = c(1.25,1.25,1))
```

```
## Warning: Removed 3566 rows containing non-finite outside the scale range
## (`stat_boxplot()`).
```

```
## Warning: Removed 20729 rows containing non-finite outside the scale range
## (`stat_boxplot()`).
```

```
## Warning: Removed 21583 rows containing non-finite outside the scale range
## (`stat_boxplot()`).
```



Question: What do you observe about the variables of interest over seasons and between lakes?

Answer: Both lakes have similar seasonal patterns, with temperatures peaking in the summer months (July and August) and dropping during the winter. Phosphorus levels remain relatively congruent in Paul lake, while Peter lake the levels are higher, peaking in September. Phosphate levels reveal a similar pattern, in Paul lake remaining relatively congruent while in Peter lake they have a higher levels, peaking in August.

6. [Niwot Ridge] Plot a subset of the litter dataset by displaying only the "Needles" functional group. Plot the dry mass of needle litter by date and separate by NLCD class with a color aesthetic. (no need to adjust the name of each land use)

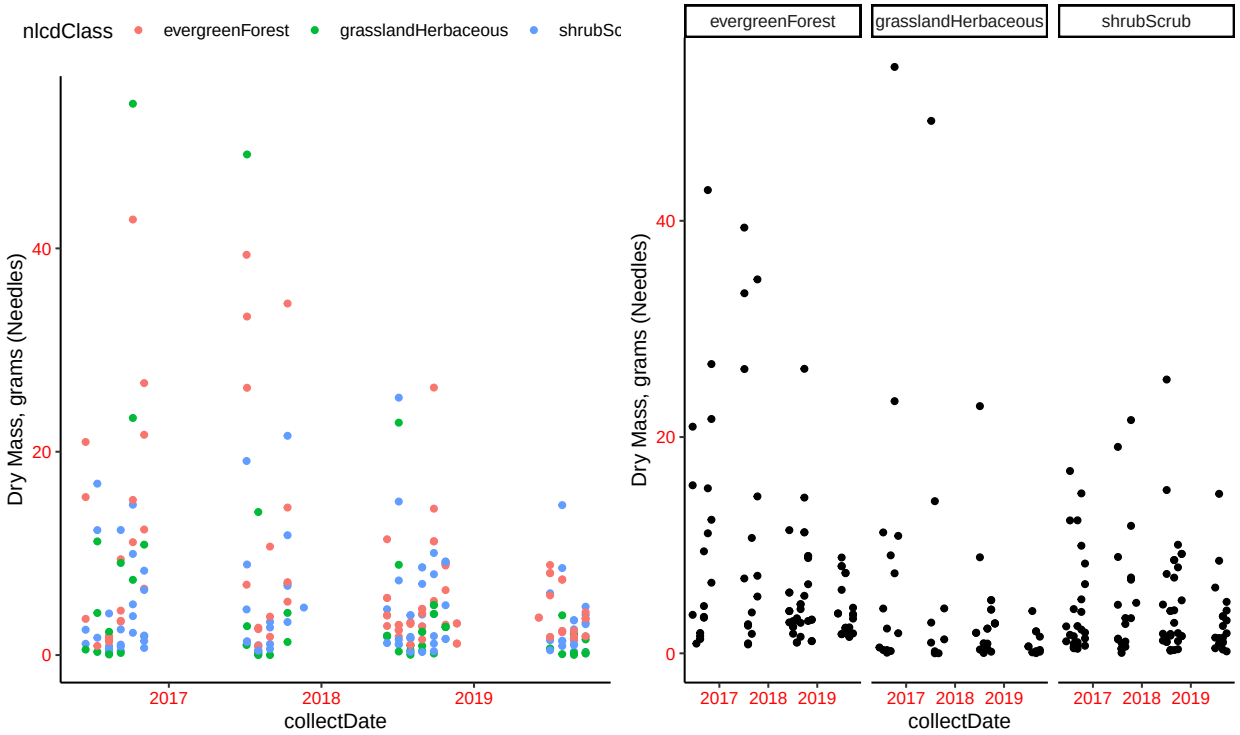
7. [Niwot Ridge] Now, plot the same plot but with NLCD classes separated into three facets rather than separated by color.

```
#6
plot6 <- ggplot(subset(NEON.litter, functionalGroup == "Needles"),
                        aes(x= collectDate,
                            y= dryMass,
                            color = nlcdClass)) +
  geom_point() +
  labs(y= "Dry Mass, grams (Needles)")
#print(plot6)

#7
plot7 <- ggplot(subset(NEON.litter, functionalGroup == "Needles"),
                        aes(x= collectDate,
                            y= dryMass)) +
  geom_point() +
  labs(y= "Dry Mass, grams (Needles)") +
```

```
  facet_wrap(vars(nlcdClass))
#print(plot7)

plot_grid(plot6, plot7)
```



Question: Which of these plots (6 vs. 7) do you think is more effective, and why?

Answer: Plot 7 is more effective because by adding the facet class it reduces the visual clutter and makes it easier to spot trends in the data. The facet also removes the need for colors, in this case giving a simpler visual to interpret.
